

PHASE 3 – PROJECT DESIGN

1. Introduction

The project design phase describes the structure and working flow of the Auto Ticket Classification system. The system is designed using ServiceNow and Flow Designer to automatically classify IT support tickets.

2. System Design

The system consists of the following main components:

1. Ticket Creation
2. Custom Incident Workflow Table
3. Category and Subcategory Fields
4. Flow Designer Automation
5. Automatic Ticket Classification
6. Email Notification

3. Ticket Data Structure

A custom table named Incident Workflow is used to store ticket records. The table contains the following fields:

Field	Type
Number	Auto Number
Caller	Reference
Category	Choice
Subcategory	Choice
Short Description	String
Description	String
State	Choice
Assigned Group	Reference
Assigned To	Reference

The project document specifies these fields and their corresponding data types.

4. Category and Subcategory Design

The Subcategory field is designed as a dependent field. Its available choices depend on the selected Category.

Category	Network	Hardware	Access	Performance
Subcategory	Wi-Fi	Projector	Forgot Password	Slow Computer

This dependency helps maintain consistent and structured ticket information.

5. Flow Design

The Flow Designer automation is named:

Auto Classify School IT Tickets

The flow is triggered when a new record is created in the Incident Workflow table and the Category field is empty.

Classification Logic:

The flow checks the Short Description for predefined keywords.

If Wi-Fi or Network is found:

Category → Network

Subcategory → Wi-Fi

If Projector is found:

Category → Hardware

Subcategory → Projector

If Forgot Password is found:

Category → Access

Subcategory → Forgot Password

If Slow Computer is found:

Category → Performance

Subcategory → Slow Computer

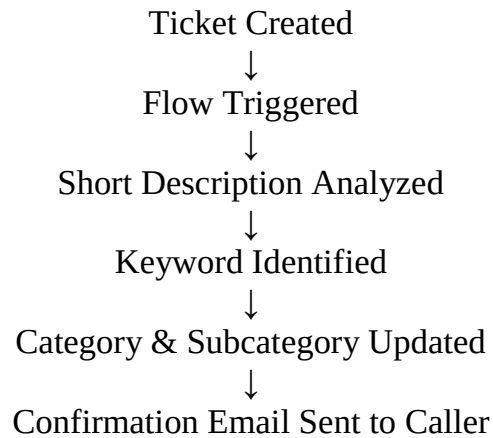

These conditions and update actions are implemented through Flow Designer.

6. Notification Design

After the ticket is classified, Flow Designer sends an email notification to the caller.

The email contains a confirmation message indicating that the request has been submitted.

7. Overall Workflow

8. Expected Design Outcome

The designed system provides an automated and structured process for classifying school IT support tickets. It reduces manual classification work and provides consistent ticket categorization through a no-code Flow Designer solution.
