

PHASE 2 – REQUIREMENT ANALYSIS

1. Introduction

The requirement analysis phase identifies the requirements needed to develop the Auto Ticket Classification system for the school IT helpdesk.

The system is designed to automatically classify IT support tickets based on the issue described by the student or teacher.

2. Business Requirements

The system should:

1. Automatically classify IT tickets based on the issue description.
2. Assign the appropriate Category and Subcategory without manual intervention.
3. Maintain a dependency between Category and Subcategory.
4. Send an automated email notification to the caller after ticket creation.
5. Store ticket information in a structured and standardized format.
6. Support easy maintenance and future scalability.

3. Functional Requirements

Ticket Management

- ✓ The system should allow users to create IT support tickets.
- ✓ A unique ticket number should be generated automatically.
- ✓ Caller information should be captured.

Automatic Classification

- ✓ The system should analyze the ticket's short description.
- ✓ The system should identify predefined keywords.
- ✓ Based on the identified keyword, Category and Subcategory should be assigned automatically.

Category and Subcategory

The system should support the following classification:

Category	Network	Hardware	Access	Performance
Subcategory	Wi-Fi	Projector	Forgot Password	Slow Computer

Email Notification

- ✓ An automated email should be sent to the caller after ticket creation.
- ✓ The email should confirm that the request has been submitted.

4. Data Requirements

The ticket table should contain the following fields:

- Number
- Caller
- Category
- Subcategory
- Short Description
- Description
- State
- Assigned Group
- Assigned To

The project document specifies the corresponding field types, including Auto Number, Reference, Choice, and String fields.

5. Technical Requirements

The project requires:

- ServiceNow
- Flow Designer
- Custom ticket table
- Choice fields
- Reference fields
- Dependent Category and Subcategory fields
- Automated email action

6. Non-Functional Requirements

- ✓ Maintainability: The solution should be easy to maintain.
- ✓ Scalability: The system should support future extensions.
- ✓ Accuracy: Ticket information should be stored consistently.
- ✓ Usability: The classification process should reduce manual effort.
- ✓ Security: Only authorized users should access or modify ticket information.

7. Expected Input

The primary input is the Short Description entered while creating an IT support ticket.

Examples:

- ✓ "WiFi not working in library"
- ✓ "Projector not turning on"
- ✓ "Forgot password"
- ✓ "Computer is slow"

8. Expected Output

Based on the entered issue, the system should automatically assign the appropriate Category and Subcategory and send a confirmation email to the caller.
