

PHASE 5 – PROJECT DEVELOPMENT

1. Introduction

The development phase focuses on implementing the Auto Ticket Classification system in ServiceNow.

The project uses a custom table and Flow Designer to automatically classify IT support tickets.

2. Creation of Custom Table

A custom table named Incident Workflow is created to store the IT ticket records. The table is configured with an automatic number generation feature so that each ticket receives a unique ticket number.

3. Field Creation and Configuration

The required fields are created in the Incident Workflow table.

The fields include:

- Number
- Caller
- Category
- Subcategory
- Short Description
- Description
- State
- Assigned Group
- Assigned To

Appropriate data types such as Auto Number, Reference, Choice, and String are configured for these fields.

4. Category and Subcategory Configuration

The Category and Subcategory fields are configured as choice fields. The Subcategory field is made dependent on the Category field so that the available subcategory options correspond to the selected category.

The configured relationships are:

- Wi-Fi → Network
- Projector → Hardware
- Forgot Password → Access
- Slow Computer → Performance

5. Flow Designer Development

A new Flow Designer flow named Auto Classify School IT Tickets is created. The flow uses the Record Created trigger on the Incident Workflow table. The flow runs when a new ticket is created and the Category field is empty.

6. Automatic Ticket Classification

The flow contains conditional logic to identify the issue from the Short Description.

Wi-Fi Classification: If the Short Description contains Wi-Fi or Network:

Category → Network

Subcategory → Wi-Fi

Projector Classification: If the Short Description contains Projector:

Category → Hardware

Subcategory → Projector

Password Classification: If the Short Description contains Forgot Password:

Category → Access

Subcategory → Forgot Password

Slow Computer Classification: If the Short Description contains Slow Computer:

Category → Performance

Subcategory → Slow Computer

7. Email Notification

After classification, an automated email action is configured in Flow Designer. The email is sent to the caller's email address with a confirmation message indicating that the request has been submitted.

8. Flow Activation

After completing the required conditions and actions, the flow is activated so that it can process newly created IT tickets.

9. Development Outcome

The development phase produces a working no-code automation that:

- ✓ Creates and stores IT ticket records.
- ✓ Automatically identifies the issue type.
- ✓ Assigns Category and Subcategory.
- ✓ Maintains dependent choice fields.
- ✓ Sends an email notification to the caller.
- ✓ Reduces the need for manual ticket classification.
